Claims

- 1. Apparatus for cooling a magnetron, comprising:
 - a target assembly;
 - a cooling cavity having an outlet port disposed therein;
- a magnetron disposed in the cooling cavity in a spaced-apart relation to the target assembly;
 - a stationary conduit;
 - a rotary union coupled to the stationary conduit; and
- a hollow drive shaft coupled at a first end to the stationary conduit by the rotary union and having a second end coupled to the magnetron, wherein a flowpath is defined extending co-axially from the second end of the hollow drive shaft to a portion of a target assembly.
- 2. The processing chamber of claim 1 further comprising a seal interfacing with the hollow drive shaft proximate the second end.
- 3. The processing chamber of claim 2 further comprising a flange coupled to the cooling cavity and having the hollow drive shaft disposed therethrough, the seal disposed between the hollow drive shaft and the flange.
- 4. The processing chamber of claim 3 further comprising a bearing assembly coupled between the flange and the hollow drive shaft.
- 5. The processing chamber of claim 4, wherein the seal prevents fluid from passing from the cooling cavity to the bearing assembly along an exterior of the hollow drive shaft.
- 6. The processing chamber of claim 2, wherein the hollow drive shaft delivers coolant about a rotational axis of the magnetron.
- 7. The processing chamber of claim 6, wherein the hollow drive shaft delivers coolant about a rotational axis of the magnetron to a central area of a sputtering target assembly.

- 8. The processing chamber of claim 2, wherein the hollow drive shaft delivers coolant about a rotational axis of the magnetron to a central area of a sputtering target assembly and to a region of the magnetron about the rotational axis of the magnetron.
- The processing chamber of claim 1 further comprising:
 a bearing assembly engaged with the hollow drive shaft; and
 a seal for isolating the bearing assembly from the cooling cavity.
- 10. The processing chamber of claim 9, wherein the seal engages the exterior of the hollow drive shaft proximate the cooling cavity.
- 11. The processing chamber of claim 9 further comprising a motor assembly for imparting rotational motion to the magnetron.
- 12. An apparatus for cooling a magnetron, comprising:
 - a chamber;
 - a substrate support member disposed within the chamber;
 - a stationary conduit;
- a hollow drive shaft rotatably coupled to the stationary conduit and having at least a portion of a flowpath defined therein, the flowpath extending co-axially from the hollow drive shaft to a portion of a target assembly;
- a magnetron coupled to the hollow drive shaft and maintained in a spaced-apart relation to the target assembly;
- a cooling cavity surrounding the magnetron and having an outlet disposed therein, the flowpath extending from the center portion between the magnetron and target assembly to the outlet; and
 - a bearing assembly engaged with the hollow drive shaft; and a seal for isolating the bearing assembly from the cooling cavity.
 - g a saming account, now accounting carry,
- 13. The processing chamber of claim 12, wherein the seal engages the exterior of the hollow drive shaft proximate the cooling cavity.

- 14. The processing chamber of claim 13, wherein the processing chamber comprises a physical vapor deposition chamber.
- 15. The processing chamber of claim 12 further comprising a motor assembly interfaced with the bearing assembly and coupled to the hollow drive shaft for imparting rotational motion to the magnetron.
- 16. Apparatus for cooling a magnetron, comprising:
 - a stationary conduit;
 - a rotary union coupled to the stationary conduit;
 - a flange for mounting to a cooling cavity housing a magnetron;
- a hollow drive shaft coupled at a first end to the stationary conduit by the rotary union and having a second end extending through the flange for coupling to the magnetron;
- a bearing assembly engaged with the hollow drive shaft to facilitate rotation of the shaft relative the mounting flange; and
 - a seal disposed between the hollow drive shaft and the flange.
- 17. The processing chamber of claim 16, wherein the seal engages the exterior of the hollow drive shaft.
- 18. The processing chamber of claim 17 further comprising a motor assembly interfaced with the bearing assembly and coupled to the hollow drive shaft for imparting rotational motion to the shaft.
- 19. The processing chamber of claim 18, wherein the motor assembly further comprises:
- a cylindrical section engaging an exterior portion of the bearing assembly and adapted to engage a drive belt; and
 - a top section coupling the cylindrical section to the hollow drive shaft.
- 20. The processing chamber of claim 16, wherein a flowpath is defined extending co-axially from the second end of the hollow drive shaft.
